

# Teoremas de Stokes y Gauss

Feb 16

$$\int_{\Gamma} \mathbf{F} \cdot d\vec{\mathbf{z}} \stackrel{\text{Green}}{=} \iint_{\Omega} Q_x - P_y \, dx \, dy$$

$$\mathbf{F} \in \mathbb{R}^2$$

$$\mathbf{F}(x,y) = (P(x,y), Q(x,y))$$

Stokes  $\mathbb{R}^3$

$$\int_{\substack{\Gamma \\ \Gamma = \partial S}} \mathbf{F} \cdot d\vec{\mathbf{s}} = \iint_S \nabla \times \mathbf{F} \cdot d\vec{\mathbf{S}}$$

$$\nabla \times \mathbf{F} = \det \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \partial_x & \partial_y & \partial_z \\ P & Q & R \end{vmatrix}$$

$$\mathbf{F} = (F_1, F_2, F_3)$$

$$= \left( \frac{\partial R}{\partial y} - \frac{\partial Q}{\partial z}, -\left( \frac{\partial R}{\partial x} - \frac{\partial P}{\partial z} \right), \frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y} \right)$$

$$\nabla \times F = \left( \frac{\partial F_3}{\partial y} - \frac{\partial F_2}{\partial z}, \frac{\partial F_1}{\partial z} - \frac{\partial F_3}{\partial x}, \frac{\partial F_2}{\partial x} - \frac{\partial F_1}{\partial y} \right)$$

Gauss : Divergencia

Diver. negat.

Divergencia positiva

$$\text{div} \underset{\substack{\uparrow \\ \mathbb{R}}}{F} = \left( \frac{\partial F_1}{\partial x} + \frac{\partial F_2}{\partial y} + \frac{\partial F_3}{\partial z} \right)$$

$$\oint_S F \cdot \eta \, ds = \iiint_{\Omega} \overbrace{\text{div}(F)}^{\in \mathbb{R}} \, dv$$

**Ejercicio 10.** Calcular la integral de línea  $\int_C \mathbf{F} \cdot d\mathbf{s}$  donde  $\mathbf{F}$  es el campo vectorial definido por

$$\mathbf{F}(x, y, z) = (2xy + z^2, x^2 - 2yz, 2xz - y^2)$$

y  $C$  es la curva que está contenida en la esfera  $x^2 + y^2 + z^2 = 1$  y el plano de ecuación  $y = x$  recorrida desde el punto  $(\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}, 0)$  al polo norte.

$$\nabla \times \mathbf{F} = \det \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ F_1 & F_2 & F_3 \end{vmatrix}$$

$$= \left( \frac{\partial F_3}{\partial y} - \frac{\partial F_2}{\partial z}, -\left( \frac{\partial F_3}{\partial x} - \frac{\partial F_1}{\partial z} \right), \frac{\partial F_2}{\partial x} - \frac{\partial F_1}{\partial y} \right)$$

$$= \left( -2y - (-2y), -(2z - 2z), 2x - 2x \right)$$

$$= (0, 0, 0)$$

$$\int_C \mathbf{F} \cdot d\mathbf{s} = f(q) - f(p)$$

$$= f(0, 0, 1) - f\left(\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}, 0\right)$$

$$\mathbf{F}(x, y, z) = (2xy + z^2, x^2 - 2yz, 2xz - y^2)$$

$$\underbrace{\frac{\partial f}{\partial x}} \quad \underbrace{\frac{\partial f}{\partial y}} \quad \underbrace{\frac{\partial f}{\partial z}}$$

$$\left. \begin{aligned} f_x(x, y, z) &= 2xy + z^2 \\ f_y &= x^2 - 2yz \\ f_z &= 2xz - y^2 \end{aligned} \right\} \Rightarrow \begin{cases} f = yx^2 + xz^2 + C(y, z) \\ f = yx^2 - zy^2 + C(x, z) \\ f = xz^2 - zy^2 + C(x, y) \end{cases}$$

$$f(x, y, z) = yx^2 + xz^2 - zy^2$$

$$f(0, 0, 1) = 0$$

$$f\left(\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}, 0\right) = \frac{1}{\sqrt{2}} \cdot \left(\frac{1}{\sqrt{2}}\right)^2 = \frac{1}{2\sqrt{2}} = \frac{\sqrt{2}}{4} //$$

$$\int_C \mathbf{F} \cdot d\mathbf{s} = -\frac{\sqrt{2}}{4}$$

$$z \approx 0,3$$

Fdo 17  
Mercurio.

**Ejercicio 11.** Rehacer el ejercicio 17 de la práctica 2 usando el teorema de Gauss.

o Guía Práctica 2:

↳

**Ejercicio 17.** Evaluar el flujo saliente del campo  $\mathbf{F}(x, y, z) = (x, y, z)$  a través del borde del cubo  $[0, 1] \times [0, 1] \times [0, 1]$ .

$$\iint_S \mathbf{F} \cdot \mathbf{n} d\mathbf{S} =$$

$$= \iiint_{\Omega} \operatorname{div}(\mathbf{F}) dV$$

$$\operatorname{div} \mathbf{F} = \frac{\partial F_1}{\partial x} + \frac{\partial F_2}{\partial y} + \frac{\partial F_3}{\partial z}$$

$$= 1 + 1 + 1$$

$$= 3$$

$$= \int_{x=0}^1 \int_{y=0}^1 \int_{z=0}^1 3 dV$$

$$= 3 //$$

**Ejercicio 12.** Calcular  $\int_S (x + y + z) dS$  donde  $S$  es el borde de la bola unitaria, es decir

$$S = \{(x, y, z) : x^2 + y^2 + z^2 = 1\}.$$

$$f(x, y, z) = (x + y + z) \in \mathbb{R}$$

$$\int_S f dS =$$

$$= \iint_{u, v} f(T(u, v)) \cdot \|T_u \times T_v\| du dv$$

Es f6rnicer

$$x = r \cdot \cos \theta \cdot \sin \varphi$$

$$y = r \cdot \sin \theta \cdot \sin \varphi$$

$$z = r \cdot \cos \varphi$$

$$\int_S \langle F, \eta \rangle dt = \iiint_{\Omega} \operatorname{div}(F)$$

$$\langle F, \eta \rangle = f(x, y, z)$$

$$\langle (F_1, F_2, F_3), ( \quad ) \rangle = x + y + z$$

$$\left\langle \left( \quad, \quad, \quad \right), (x, y, z) \right\rangle =$$

$$\left\langle \left( \underline{1}, \underline{1}, \underline{1} \right), (x, y, z) \right\rangle =$$

$$\underbrace{\quad}_F, \underbrace{\quad}_\eta$$

revisar

Gauss

pero  $F(T)$  no  
puede calcular div.  
o si?

$$\iint_S F \cdot \eta \, dS \stackrel{\downarrow}{=} \iiint_\Omega \operatorname{div} F \, dV$$

$$\operatorname{div} F = 0$$

$$= \iint_S x+y+z \, dS = 0 //$$

Otra forma de verlo:

$$f(x,y,z) = (x+y+z) \in \mathbb{R}$$

Sábado Feb 20

**Ejercicio 16.** Calcular el flujo del campo  $\mathbf{F}(x, y, z) = (0, 0, a^2 - x^2 - y^2)$  a través de las siguientes secciones oblicuas del cilindro  $x^2 + y^2 \leq a^2$ :

- Sección oblicua determinada por la intersección del cilindro con el plano de ecuación  $y + z = 1$ , de modo que la normal en el punto  $(0, 0, 1)$  apunte en la dirección  $(0, 1, 1)$ .
- Sección oblicua determinada por la intersección del cilindro con el plano de ecuación  $z = 0$ , de modo que la normal en el punto  $(0, 0, 0)$  apunte en la dirección  $(0, 0, 1)$ .

¿Depende el flujo del área de la sección? Justifique.

$$\iint_S \mathbf{F} \cdot \mathbf{n} \, dS = ?$$

Cierro

$$\iint_{S \cup C_i \cup B} \vec{F} \cdot \vec{n} \, d\vec{S} = \iiint_{\Omega} \operatorname{div} \vec{F} \, dV$$

$$\underbrace{\hspace{10em}}_{=0 \text{ por } \operatorname{div} \vec{F} = 0}$$

Sepero

$$\iint_{S \cup C_i \cup B} \vec{F} \cdot \vec{n} \, d\vec{S} = 0$$

$$= \iint_S \vec{F} \cdot \vec{n} \, d\vec{S} + \iint_{C_i} \vec{F} \cdot \vec{n} \, d\vec{S} + \iint_B \vec{F} \cdot \vec{n} \, d\vec{S}$$

$S$   
incógnita

$C_i$   
= Cero por  
 $\vec{F} \perp C_i \, \forall (x,y,z) \in \mathbb{R}^3$

$B$   
?

$$\iint_B \vec{F} \cdot \vec{n} \, d\vec{S} = \int_{\theta=0}^{2\pi} \int_{r=0}^a \langle \vec{F}(T(\theta, r)), (0, 0, -1) \rangle dr d\theta$$

$$T(\theta, r) = (r \cdot \sin \theta, r \cdot \cos \theta, ?)$$

$$\begin{cases} y+z=1 \Rightarrow z=1-y \\ x^2+y^2=a^2 \Rightarrow |y|=\sqrt{a^2-x^2} \xrightarrow{x \rightarrow 0} |y|=\sqrt{a^2} \end{cases}$$

$\downarrow$  si  $a \geq 0$

• si:  $a=1 \Rightarrow z=0$

Assumo  $a \geq 0$ :

$$|y| = \sqrt{a^2} \Rightarrow |y| = a$$

$$y = a$$

Reemplazo en el plano

$$z=1-y \Rightarrow \boxed{z=1-a}$$

$$T(\theta, r) = (r \cdot \sin \theta, r \cdot \cos \theta, 1-a)$$

Compongo con  $F(x,y) = (0, 0, a^2 - x^2 - y^2)$

$$F(T(\theta, r)) = (0, 0, a^2 - r^2 \cdot \sin^2 \theta - r^2 \cdot \cos^2 \theta)$$

$$= (0, 0, a^2 - r^2)$$

Then

$$\oint_{\mathcal{B}} \mathbf{F} \cdot \mathbf{n} \, d\mathbf{S} = \int_{\theta=0}^{2\pi} \int_{r=0}^a \left\langle \mathbf{F}(T(\theta, r)), (0, 0, -1) \right\rangle \overset{r}{\downarrow} dr d\theta$$

$$= \int \int \left\langle (0, 0, a^2 - r^2), (0, 0, -1) \right\rangle \overset{r}{\downarrow} dr d\theta$$

$$= \int_0^{2\pi} \int_0^a (r^2 - a^2) \cdot r \, dr \, d\theta$$

$$= \int_0^{2\pi} \left. \frac{r^4}{4} \right|_0^a - a^2 \left. \frac{r^2}{2} \right|_0^a d\theta$$

$$= \int_0^{2\pi} \frac{a^4}{4} - \frac{a^4}{2} d\theta$$

$$= \int_0^{2\pi} -\frac{1}{4} a^4 d\theta$$

$$= -\frac{1}{4} \pi a^4 //$$

Como

$$0 = \underbrace{\iint_S \mathbf{F} \cdot \mathbf{n} \, d\vec{S}}_{\text{incógnita}} + \underbrace{\iint_{C_i} \mathbf{F} \cdot \mathbf{n} \, d\vec{S}}_{=0 \text{ puer } \mathbf{F} \perp C_i \, \forall (x,y,z) \in \mathbb{R}^3} + \underbrace{\iint_B \mathbf{F} \cdot \mathbf{n} \, d\vec{S}}_{= -\frac{1}{4} \pi a^4}$$

$$\Rightarrow \iint_S \mathbf{F} \cdot \mathbf{n} \, d\vec{S} = \frac{1}{4} \pi \cdot a^4$$

(b) Sección oblicua determinada por la intersección del cilindro con el plano de ecuación  $z = 0$ , de modo que la normal en el punto  $(0,0,0)$  apunte en la dirección  $(0,0,1)$ .

¿Depende el flujo del área de la sección? Justifique.

Si, pues el flujo es:

$$\frac{4}{3} \pi \cdot a^3$$

↑ y  $a$  es el radio del cilindro.

**Ejercicio 18.** Se sabe que  $\operatorname{div} \operatorname{rot} \mathbf{G} = 0$  para todo campo vectorial  $\mathbf{G} \in C^1$ . Además, si  $\mathbf{F} \in C^1(\mathbb{R}^3)$  es tal que  $\operatorname{div} \mathbf{F} = 0$  en  $\mathbb{R}^3$ , existe  $\mathbf{G} \in C^2(\mathbb{R}^3)$  tal que  $\mathbf{F} = \operatorname{rot} \mathbf{G}$ . Por ejemplo, tomar

$$G_1(x, y, z) = \int_0^z F_2(x, y, t) dt - \int_0^y F_3(x, t, 0) dt,$$

$$G_2(x, y, z) = - \int_0^z F_1(x, y, t) dt,$$

$$G_3(x, y, z) = 0.$$

Considerar el campo gravitatorio  $\mathbf{F} = -GmM \frac{\mathbf{r}}{r^3}$ . Verificar que  $\operatorname{div} \mathbf{F} = 0$ . ¿Existe un campo  $\mathbf{G} \in C^2(\mathbb{R}^3 \setminus \{0\})$  tal que  $\mathbf{F} = \operatorname{rot} \mathbf{G}$ ?

Sugerencia: ver el ejercicio 13.

Sale como :

Handwritten mathematical derivation on a whiteboard:

$$\mathbf{G}(x, y, z) = \left( \int_0^z F_2(x, y, t) dt - \int_0^y F_3(x, t, 0) dt, - \int_0^z F_1(x, y, t) dt, 0 \right)$$

$$\nabla \times \mathbf{G}(x, y, z) = (F_1(x, y, z), F_2(x, y, z), F_3(x, y, z))$$

$$\nabla \times \mathbf{G} = \mathbf{F}$$

**Ejercicio 19.** ¿Es cada uno de los siguientes campos vectoriales el rotor de algún otro campo vectorial? De ser así, hallar el campo vectorial.

(a)  $\mathbf{F} = (x, y, z)$ .

(b)  $\mathbf{F} = (x^2 + 1, x - 2xy, y)$ .

$$\nabla \times \mathbf{F} = \det \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ F_1 & F_2 & F_3 \end{vmatrix}$$

$$= \left( \frac{\partial F_3}{\partial y} - \frac{\partial F_2}{\partial z}, \frac{\partial F_1}{\partial z} - \frac{\partial F_3}{\partial x}, \frac{\partial F_2}{\partial x} - \frac{\partial F_1}{\partial y} \right)$$

$$\frac{\partial F_3}{\partial y} - \frac{\partial F_2}{\partial z} =$$

$$\frac{\partial F_1}{\partial z} - \frac{\partial F_3}{\partial x} =$$

$$\frac{\partial F_2}{\partial x} - \frac{\partial F_1}{\partial y} =$$

a)  $\mathbf{F} = (x, y, z)$  es  $\mathbf{F} = \nabla \times \mathbf{G}$ ?

$$\operatorname{div}(\nabla \times \mathbf{G}) = 0 \quad \forall \mathbf{G}$$

$$\underbrace{\operatorname{div} \mathbf{F}}_{\text{debe ser } 0} = 0$$

$$\text{Calculo } \operatorname{div} \mathbf{F} = 3$$

∴ No es rotor de ninguna  $\mathbf{G}$ .

$$b) F = (x^2 + 1, x - 2xy, y)$$

$$\text{si } F = \nabla \times G \Rightarrow \operatorname{div} F = 0$$

$$\operatorname{div} F = 2x - 2x + 0 = 0 \quad \checkmark$$

∴ es el rotor de alguna  $G$

Lo busco (Hallando  $F = G$  por ahora)

$$\nabla \times F = \left( \frac{\partial F_3}{\partial y} - \frac{\partial F_2}{\partial z}, \quad \frac{\partial F_1}{\partial z} - \frac{\partial F_3}{\partial x}, \quad \frac{\partial F_2}{\partial x} - \frac{\partial F_1}{\partial y} \right)$$

$$\left. \begin{aligned} \frac{\partial F_3}{\partial y} - \frac{\partial F_2}{\partial z} &= x^2 + 1 \\ \frac{\partial F_1}{\partial z} - \frac{\partial F_3}{\partial x} &= x - 2xy \\ \frac{\partial F_2}{\partial x} - \frac{\partial F_1}{\partial y} &= y \end{aligned} \right\} \begin{aligned} &\left( xz, -z + xy, yx^2 \right) \\ &\parallel \\ &G \text{ que se corresponde} \\ &\text{con } F = \nabla \times G \quad // \end{aligned}$$

$$G = (xz, -z + xy, yx^2)$$

**Ejercicio 20.** Para cada  $R > 0$  sea  $S_R = \{(x, y, z) : x^2 + y^2 + z^2 = R^2, z \geq 0\}$  orientada con la normal que apunta hacia arriba, y sea el campo

$$\mathbf{F}(x, y, z) = (xz - x \cos z, -yz + y \cos z, 4 - x^2 - y^2).$$

Determinar  $R$  de modo que el flujo del campo  $\mathbf{F}$  a través de  $S_R$  sea máximo.

$$\text{máx} \iint_{S_R} \mathbf{F} \cdot \mathbf{n} \, dS = ?$$

Quiero usar Gauss

$$\iint_{S_R \cup S_T} \mathbf{F} \cdot \mathbf{n} \, dS = \iiint_{\Omega} \operatorname{div} \mathbf{F} \, dV$$

$$= \iint_{S_R} \mathbf{F} \cdot \mathbf{n} \, dS + \iint_{S_T} \mathbf{F} \cdot \mathbf{n} \, dS$$

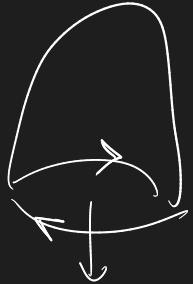

$\underbrace{\hspace{10em}}_{\text{Incongnito}}$

$\underbrace{\hspace{10em}}_{?}$

$$\begin{aligned} \operatorname{div} \mathbf{F} &= z - \cos z + (-z) + \cos z + 0 \\ &= 0 \quad \checkmark \end{aligned}$$

$$\Rightarrow \iiint_{\Omega} \operatorname{div} \mathbf{F} \, dV = 0$$

$$\circ \circ \quad \underbrace{\iint_{S_R^+} \mathbf{F} \cdot \mathbf{n} \, dS}_{\text{In c\~o gnito}} = - \underbrace{\iint_{S_T^+} \mathbf{F} \cdot \mathbf{n} \, dS}$$

$$= \iint_{S_T} \langle \mathbf{F}(T(\theta, r)), (0, 0, -1) \rangle$$

Param:  $\odot$

$$T(\theta, r) = (r \cdot \sin \theta, r \cdot \cos \theta, 0)$$

$$\mathbf{F}(T(\theta, r)) = \left( \dots, \dots, 4 - r^2 \sin^2 \theta - r^2 \cos^2 \theta \right)$$

$$\iint_{S_T} \left( r^2 \underbrace{(\sin^2 \theta + \cos^2 \theta)}_{=1} - 4 \right) \cdot r \, dr \, d\theta =$$

$$= \int_{\theta=0}^{2\pi} \int_{r=0}^R r^3 - 4r \, dr \, d\theta$$

$$= \int_0^{2\pi} \left. \frac{r^4}{4} \right|_0^R - 4 \frac{R^2}{2} \, d\theta$$

$$= 2\pi \left( \frac{R^4}{4} - 2R^2 \right)$$

=

o o

$$\iint_{S_R^+} F \cdot \eta \, dS = - \left( \frac{\pi}{2} R^4 - 4\pi R^2 \right)$$

$$= 4\pi R^2 - \frac{\pi}{2} R^4$$

$$f(R) = 4\pi R^2 - \frac{\pi}{2} R^4$$

$$f'(R) = 8\pi R - 2\pi R^3 = 0$$

$$8\pi R = 2\pi R^3$$

$$4R = R^3$$

$R \geq 0$

$$4 = R^2$$

$$2 = R \quad \checkmark$$

o o el  $R$  que maximiza el flujo a través de  $S_R$  es  $R=2$ , con  $S_2$  la superficie.
